STATEMENT ON GENETICALLY MODIFIED FEED AND ITS IMPACT ON SHELL EGGS AND EGG PRODUCTS

Eggs are not a genetically modified food. This includes shell eggs and eggs used for processed egg products. In the United States, only traditional breeding techniques are used to produce laying hens. Neither chickens nor eggs are modified by genetic engineering.

In the chance that a chicken eats genetically modified feed, the digestive process of the hen destroys any products unique to the genetic engineering. Scientific research has confirmed that none of the genetically modified materials are passed into the egg.

All products manufactured by Ballas Egg Products Corp. are non-GMO as defined by current regulations in the US and EU.
